

VIMELIN

Deshuttering coating for wooden and steel-faced formworks

Properties

VIMELIN is a deshuttering coating for wooden and steel-faced formworks based on petroleum.

VIMELIN acts both physically and chemically. It creates a thin film that cannot be removed by concrete and in addition, it reacts with the cement chemically, creating a thin separating crust. **VIMELIN**'s advantages are the following:

- Particularly strong deshuttering action
- Clean concrete surface, without any grease or oil residues
- Perfect adhesion of the plaster and paint to the concrete surface
- Avoidance of air bubbles in the surface of fair-faced concrete
- Low cost due to extremely low consumption
- Maintenance and protection of wooden and steel-faced formworks.

Applications

VIMELIN can be applied to all kind of form surfaces (wooden, steel-faced formworks).

Apply it uniformly in the thinnest possible layer and on a clean form.

Apply it using a brush or roll. For better results, spraying is recommended.

VIMELIN is ready-mixed (not to be diluted) but must be shaken well before use.

Consumption

Depending on the type and absorption capacity of the coated surface, **50-100 g/m²** are required.
